

Figure 2. Estimated probabilities of infection from untreated ground water (uncontaminated) for different scenarios. The estimated probabilities of infection from untreated ground water (uncontaminated) for different scenarios are shown in Figure 2. The probabilities are generally low, ranging from 0.0001 to 0.001, and are highest for the scenario of 100% untreated ground water (uncontaminated) and 100% untreated surface water (contaminated).
